GDdom Manual

1. Introduction

The usefulness of a given genetic marker is determined by its level of polymorphism. Gene diversity (GD), also called polymorphism information content, is a commonly used measure of molecular marker polymorphism for dominant markers such as AFLP, RAPD and multilocus SSRs. We developed a free online computer program, GDdom, which provides easy, quick and accurate calculation of dominant marker GD with the commonly used formula of Roldan-Ruiz et al. (2000): $GD_i = 2f_i (1 - f_i)$, where GD_i is the gene diversity of marker 'i', f_i is the frequency of the amplified allele (band presence), and 1 - f_i is the frequency of the null allele. According to this formula, GD for a locus can vary from 0 to 0.5. Results are presented in tabular form for quick interpretation.

2. Data preparing

Open Excel file, rows represent samples and columns represent marker alleles. In first column, write marker number followed by dash (-) and allele size, for example marker1-198. Continue adding columns for all alleles for that marker. Add columns for remaining markers and each of their alleles (e.g. marker2-165, marker2-180) (Figure 1). Score alleles for each dominant marker and individual sample as presence (1), absence (0) and 9 for missing data.

Figure 1. Excel file showing marker name and allele size in columns. Rows from 2 to 22 represent marker scoring for 21 genotypes which were scored as presence (1), absence (0) or missing data (9).

3. Saving the file

From file menu, the data file should be saved as "CSV (Comma delimited)" or "CSV (MS-DOS)" as illustrated in Figure 2.

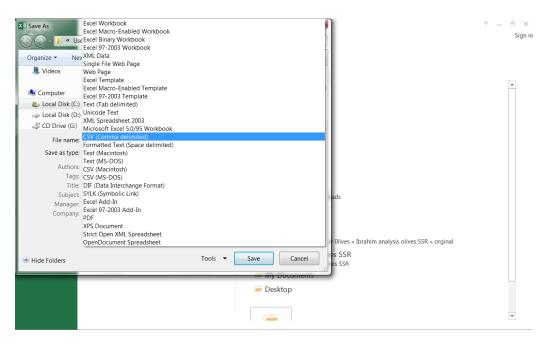

Figure 2. Saving Excel data file as CSV format.

4. Data analysis

Open GDdom program using the link (<u>http://plantmolgen.iyte.edu.tr/GDdom/</u>), upload CSV data file and submit. The program summarizes all data in tabular form. The first output table describes the missing values for all samples (Figure 3). The second table shows detailed results for the number of alleles, number of polymorphic alleles, average GD value, standard deviation and standard error (Figure 3). The third table gives summary statistics for the average GD value for each marker (Figure 4). The final table includes maximum, minimum and average GD over all markers (Figure 4).
